

Bloodborne Pathogens in the Workplace

The easy and economical solution to satisfying OSHA requirements

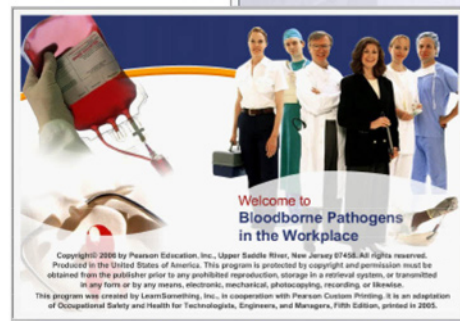

If your employees are part of the 5.6 million workers who have occupational exposure to bloodborne pathogens, then OSHA requires you to provide a training program on minimizing the dangers.

Bloodborne Pathogens in the Workplace is a dynamic, interactive web-based learning program to help you achieve compliance.

Your obligations include providing initial and annual training to any worker who administers immunizations or lipid tests, handles diabetes equipment, or similar workplace activities. Exposure can come in the form of accidental needlestick, contact with blood from open wounds, or saliva from an infected person.

This comprehensive program provides employers with an employee training strategy with the specific content and best practices employees need to work safely and minimize risk. This course may be customized to include your procedures for exposure incident reporting and post-exposure evaluation.

Minimize your liability and protect your employees from bloodborne pathogens with the Bloodborne Pathogens in the Workplace training course.

The LearnSomething System – Deliver. Track. Comply.

Deliver this course and track employee completion via your LearnSomething System to create an easy and economical solution that minimizes your potential liability.
